Produkt-Tags: UV , VIS , NIR

I (x - y) nm

Überblick

The radiant intensity of a light source, is the emitted light in a given direction. Radiant intensity is the radiometric measurement quantity used to calibrate directionally emitted light from lamps. Radiant intensity is measured with an irradiance detector equipped with a precise front aperture then calculated from the measured irradiance and the solid angle resulting from the light source to aperture distance and the aperture diameter. A factory calibration certificate is provided.

Bestellinformationen

Artikel-Nr	Modell	Beschreibung
Kalibrierung		
	KLW-S4-01	Spectral Radiant Intensity of Spot lamps. Contact the factory to discuss calibration details.
	KLW-S4-RP	Set-up charge for non-Gigahertz-Optik sources
