BTS256-LED

https://www.gigahertz-optik.de/en-us/product/BTS256-LED

Product tags: VIS
Description

The photometric specifications of LEDs must commonly meet very high tolerance requirements even for non-specialist applications such as general and automotive lighting. This is often a problem since the manufacturing tolerances of LEDs can be higher than those permitted in the applications. The tolerance limits offered by LED manufacturers’ intensity and color based binning are only applicable if the operating conditions are similar to those in the binning tests. Therefore, manufacturers incorporating LEDs into their products require devices that can accurately measure the precise in-situ photometric performance of LEDs.

Compact spectral radiometer

The compact BTS256-LED enables you to conveniently measure the luminous flux, spectrum, color, and color rendering indices of single LEDs. One special feature is the conical measurement port of the device. The ability to perform measurements of onboard LEDs makes it possible to also include thermal effects in the measurement. The luminous flux, color, color rendering indices and spectrum of an LED are all typically measured within a few seconds. The device is therefore ideal for inspection of incoming products as well as the quality control in production processes. It can also be very useful in the design department.

The BTS256-LED comes in a compact aluminum housing and offers all functions that are necessary for precise measurement of the luminous flux, spectrum, color, and color rendering indices. For greatest accuracy and versatility, this device is based on a BiTec light sensor that consists of a V-lambda-filtered Si photodiode and a spectrometer unit that has a CMOS diode array. Si photodiodes are unsurpassed in terms of dynamic range, linearity, and speed. The CMOS diode array-based spectrometer guarantees precise measurement data of the luminous spectrum which is used to determine the color values. The combination of the two detectors enables mutual correction (see article on the BTS technology) for greater precision. This also makes it possible to perform accurate, time-synchronized measurements, e.g., of PWM signals. One cutting-edge feature of the BTS256-LED is its remote-controlled shutter for dark current compensation of the array as well as its software-controlled auxiliary lamp for compensation of light absorbed by the measurement samples (self-absorption correction). The remote control takes place via a USB 2.0 interface using the supplied S-BTS256 software.

Calibration

One essential quality of photometric devices is their precise and traceable calibration. Calibration of the BTS256-LED is performed in Gigahertz-Optik’s calibration laboratory that is accredited by DAkkS (D-K-15047-01-00) for the spectral responsivity and spectral irradiance according to ISO/IEC 17025. The device has two calibrations: one is done using a specially developed reference lamp offering 2pi illumination which enables precise measurement of the luminous flux of diffusely emitting LEDs. The second calibration is for sources that have narrower illumination characteristics.

Options for the BTS256-LED

- Software development kit to enable users to integrate the device in their own software
- Extension to the BTS256-LED Plus Concept (for illuminance and luminous intensity) using other components

### Spectral Detector

| Chip | CMOS diode array |
| spectral range | (360 - 830) nm |
| Optical Bandwidth | 5 nm |
| Data Resolution | 1 nm |
| Integration Time | (5.2 - 30000) ms |
| Shutter | Automatic aperture for dark signal measurements with the same integration time as that of light measurements. Aperture delay = 100ms . |
| typical measurement time | 1100 lm ≤ 5ms (white light) |
|                         | 10 mlm ≤ 30s (white light) |
| Peak wavelength | ± 0.5 nm |
| Dominant wavelength | ± 1 nm |
| Repeatability Δx and Δy | ± 0.0001 (Standard illuminant type A) |
|                         | ± 0.0002 (LED) |
| Δy Δx uncertainty | ± 0.002 (Standard illuminant type A) |
|                         | ± 0.005 (typ. LED) |
| CCT Measurement range | (1700 - 17000) K |
| ΔCCT | ± 50K (standard illuminant type A) |
|                         | ± 3% (depending on the LED spectrum) |
| CRI (color rendering index) | Ra and R1 to R15 |
## Stray Light

| 6E-4 (Blue LED) |
| 6E-4 (Green LED) |
| 6E-4 (Red LED) |
| 1E-3 (White LED) |

### Integral Detector
